AGENTIC INTELLIGENCE FOR HONG KONG'S POLICYMAKERS

CITY DATA → ANSWERS

CITYPILOT.UP.RAILWAY.APP

— THE PROBLEM

6,000 DATASETS 80 BUREAUS

Hong Kong collects data on every dimension of city life. Most of it is still gathered manually — **never joined, never shared.** It ends up unused.

 THE PROBLEM

A simple policy question takes **days**.

Coordinate across departments. Pull from incompatible systems. Wait for analysts to stitch it together. By the time the answer arrives, it's already too late.

Not a ~~data~~ problem.
An **access** problem.

— THE SOLUTION

We built Agora.

Ask in plain language. Agora pulls the relevant data and returns a **structured, evidence-backed answer** – in seconds.

● ● ● agora – live session

- 4) Results
- 5) Conclusions and implications
- 6) Appendix

1) Executive summary

- Data access to Hong Kong's official hourly station-level air quality (EPD AQMN) was not available programmatically in this environment. This report therefore uses a 72-hour air-quality forecast for central Hong Kong to provide the latest conditions and includes robust 30-day hourly weather observations. All limitations are clearly flagged below.
- Over the next 72 hours, forecast city-centre concentrations peak around $\text{PM}_{2.5} \approx 54 \mu\text{g}/\text{m}^3$, $\text{NO}_2 \approx 84 \mu\text{g}/\text{m}^3$, and $\text{O}_3 \approx 62 \mu\text{g}/\text{m}^3$. Ozone shows daytime peaks aligned with higher temperatures and lower rainfall.
- Weather over the last 30 days featured early-June heat (daily mean up to $\sim 30.5^\circ\text{C}$) and several heavy-rain days (e.g., $\sim 36 \text{ mm}$ on 2026-05-20; $\sim 26.5 \text{ mm}$ on 2026-06-06), conditions that often modulate particulate and ozone levels.
- Recent coverage highlights heat-related risks and calls for stronger climate policy; air-pollution-specific alerts in major English press were limited over the past 14 days.
- Benchmarking against Hong Kong AQOs and WHO 2021 $\text{PM}_{2.5}$ guideline ($15 \mu\text{g}/\text{m}^3$ 24-hour) is noted for context; exceedance counting is omitted pending access to observed station data and full 8-hr O_3 rolls.

— WHY IT'S DIFFERENT

Not a chatbot on one database — a **centralised intelligence layer** that connects everything, and gets smarter the more you connect.

01

Two agents.

One understands what you're asking. The other does the work.

02

Sandboxed by design.

Every session is isolated at the infrastructure layer — not the prompt. It can't be talked around.

03

Paste a link.

The agent ingests any new source instantly. All sources, one place.

— THE ASK

\$117B

Smart-city market by 2030. Every government is sitting on data it can't use. Hong Kong is where we start.

We're live. We want our first pilot.

Let us show you what happens when your city can finally **answer its own questions.**
